TITLE: DEPLOY FASTAPI WITH POSTGRESQL ON RENDER

with working todo-lists application and fastapi

- This is my full-stack todo-list web application using React as the frontend, and fastAPI as the backend. The app has a CRUD (create, read, update, delete). React is deployed through github pages, while fastAPI is deployed in render.

GET	/tasks/	Get Tasks
POST	/tasks/	Add Task
PUT	/tasks/{task_id}/	Update Task
DELETE	/tasks/{task_id}/	Delete Task

DIFFERENCES: The difference between *Django REST framework* and *FastAPI* is they are both setup in a different way. While Django takes time to setup; install few packages because it is a full-stack web app where we can store the backend, have more files to control and harder to integrate especially I am beginner in this; FastAPI is hassle-less and easier to control since the files are not complex nor too many unlike Django. But another difference is Django has an admin panel in which we are allowed to store our databases with authentications while FastAPI do not.

ADVANTAGE & DISADVANTAGE	
DJANGO REST FRAMEWORK	FASTAPI
Django REST framework has the admin panel in which databases can stay secured.	I still haven't tried to explore the FastAPI but based on my beginner experience, fastapi do not have an admin panel.
Based on my additional research, Django is slower.	While FastAPI is faster than Django.
It has a lot of files and packages that needs to install.	It is lightweight as it only has the files it needed.

The challenges I faced while working with both DRF and FastAPI is setting up both. While DRF has a lot of things to do before I can actually start working on with its web app, publishing it to Render was a difficult task especially that I have encountered numerous errors before I finally deployed it with live link. I also

had challenges to integrate it with my React frontend. What I did was to find solution through these different platforms: YouTube to find a solution close to my error, ChatGPT to help me identify the bugs I overlooked, and Google. For the FastAPI, I only had few challenges since all the files are easily to locate if I have an error.
